

R Programming

Unit- I

Introduction

- R is a programming language specially designed for statistical data analysis and graphical representation.
- Ross Ihaka , Robert Gentleman and their team developed R at AT&T Bell Laboratories.
- Like other programming language , R also has large no. of built-in packages ,functions and operators.

- It is a s/w package that contains different tools.
- These tools provide different types of facilities for data manipulation ,data calculation and data storages along with graphics display facilities.
- It provides an interactive environment where the user can perform complex mathematical calculations.
